Fraud Investigation Guidelines

Evidence collection and case documentation playbook

Version	1.0
Classification	Internal demonstration
Owner	Fraud Operations

Investigation standard: distinguish observed facts, model interpretation, policy guidance, and missing evidence.

Case intake

Confirm the event

Verify transaction identifier, amount, type, origin, destination, time, channel, and processing status.

Preserve decision evidence

Capture model probability and version, unified score, rule hits, behavioral signals, SHAP factors, and the exact evidence available at decision time.

Evidence checklist

Origin account

Review prior amounts, velocity, balance changes, beneficiary history, device, IP, authentication, channel, profile changes, and customer contact.

Destination account

Review fan-in, repeated origins, downstream movement, linked alerts, account age, identity, device overlap, and merchant context when available.

Transaction context

Check whether the amount is unusual, whether funds were fully depleted, whether timestamps indicate rapid activity, and whether data-quality issues explain balance errors.

Analysis and disposition

Avoid confirmation bias

Consider legitimate explanations and protective model factors. Do not treat a triggered rule or SHAP factor as proof.

Disposition

Record confirmed fraud, false positive, or inconclusive. Summarize facts, missing evidence, customer impact, action taken, and rationale.

Escalation

Escalate scores above 80 and strong rapid-depletion patterns. For scores above 60, complete manual review before resolution.

Minimum investigation note

Required content

State why the alert was generated, key evidence reviewed, contradictory or missing evidence, related-account findings, customer contact outcome if any, recommended action, and final disposition.

Grounding

AI-generated notes must cite retrieved case or policy evidence and must be reviewed by the investigator before saving.
